Exploratory Data Analysis — Summary

1. Introduction

1.1 Example Datasets

1.2 Before we start ...

2. First Pass — Load Dataset and Initial Clean

2.1 dtypes

2.2 Missing Values

3. A Selection of Statistical Visualisations and Metrics

3.1 Categorical Features

3.2 Numerical Features

Acknowledgment

A big thanks to Dr Kieran Murphy, who provided many of the slides for today's lecture.

Introduction

Exploratory Data Analysis (EDA)

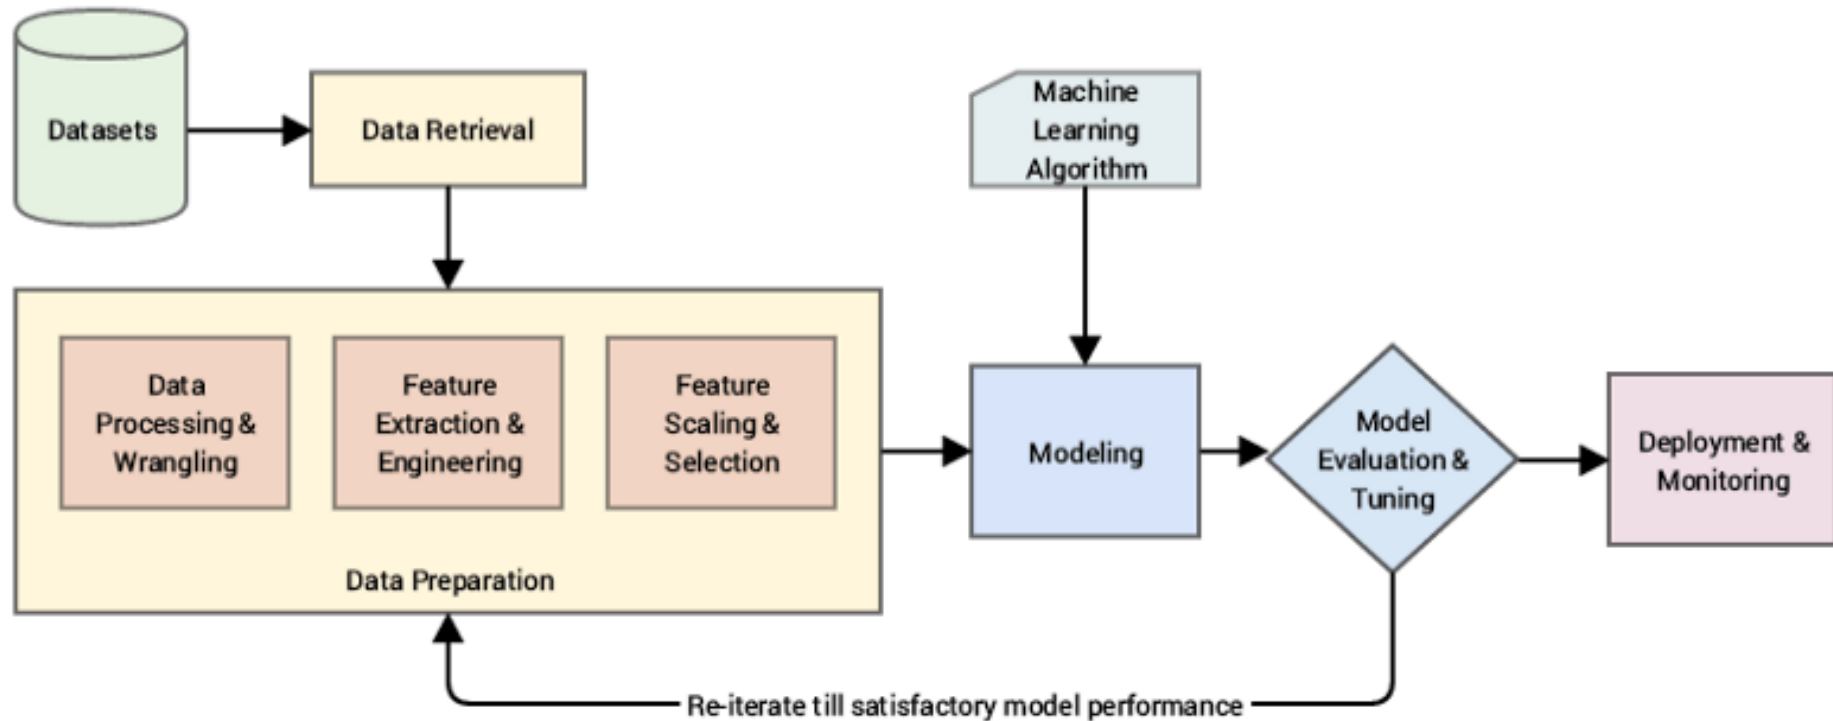

Aim

To understand and summarise a dataset to ensure that the features which are feed to machine learning algorithms are refined and that the results are valid and can correctly interpreted.

Benefits

- Develop insight about the dataset and understanding of the underlying structure.
- Extract important parameters and relationships that hold between them.
- Test underlying assumptions.
- Identify issues that affect model performance — outliers, missing values.

Data Pipeline

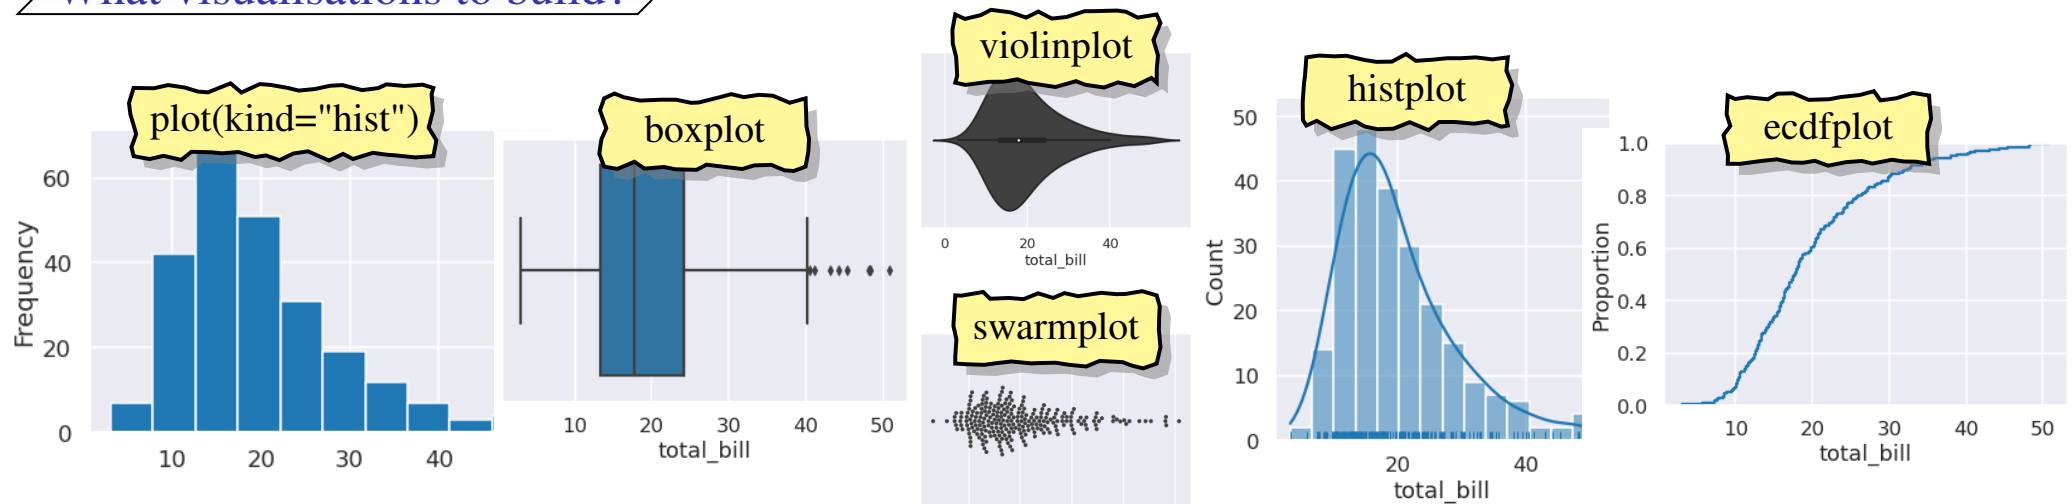

- Data preparation is the core of the data mining pipeline (typical estimates >50% of the time/effort).
- EDA is the data processing and wrangling.
- EDA informs the feature extraction, engineering, transformation and selection.

The Bad News — ‘The curse of choice’

What questions to ask?

Dataset global questions: How many features? How many observations? What is the data type of each feature? Any null values? ... Feature specific questions: What is the distribution of each variable? Do there appear to be outliers? What features are related? ... Missing value questions: Are null value a result of the way data was recorded? Can we drop the rows with null values without it significantly affecting your analysis? Can we justify filling in the missing values with the mean or median for that variable? If the data is time-series data, can we fill the missing values with interpolation? Are there so many missing values for a variable that we should drop that variable from the dataset? ... Outlier questions: Why are outliers present? Do the outliers represent real observations (i.e. not errors)? Should we exclude these observations? If not, should we winsorise the values? ... Correlations/Relationships questions: Which variables are most correlated with your target variable? (If applicable) Is there multicollinearity? (Two features that have a correlation > 0.8) How will this affect your model? Do you have variables that represent the same information? Can one be dropped? ...

What visualisations to build?

Have a plan, be selective, understand strengths/weaknesses of metrics/visualisations

Terminology / Notation

$n + 1$ columns / variables

X

n features / attributes / dimensions

y
target

$\mathbf{x}^{(i)}$

\mathbf{x}_j

m observations / instances / cases / rows

PassengerId	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked	Survived
1	3	Braund, Mr. Owen Harris	male	22.0	1	0	A/5 21171	7.2500	NaN	S	0
2	1	Cumings, Mrs. John Bradley (Florence Briggs Th...	female	38.0	1	0	PC 17599	71.2833	C85	C	1
3	3	Heikkinen, Miss. Laina	female	26.0	0	0	STON/O2. 3101282	7.9250	NaN	S	1
4	1	Futrelle, Mrs. Jacques Heath (Lily May Peel)	female	35.0	1	0	113803	53.1000	C123	S	1
5	3	Allen, Mr. William Henry	male	35.0	0	0	373450	8.0500	NaN	S	0
6	3	Moran, Mr. James	male	NaN	0	0	330877	8.4583	NaN	Q	0
7	1	McCarthy, Mr. Timothy J	male	54.0	0	0	17463	51.8625	E46	S	0
8	3	Palsson, Master. Gosta Leonard	male	2.0	3	1	349909	21.0750	NaN	S	0
9	3	Johnson, Mrs. Oscar W (Elisabeth Vilhelmina Berg)	female	27.0	0	2	347742	11.1333	NaN	S	1
10	2	Nasser, Mrs. Nicholas (Adele Achem)	female	14.0	1	0	237736	30.0708	NaN	C	1
11	3	Sandstrom, Miss. Marguerite Rut	female	4.0	1	1	PP 9549	16.7000	G6	S	1

- A labeled dataset consists of m rows \times $(n + 1)$ columns / variables.
- Use bold to represent vectors and matrices.
- Use subscripts to indicate particular **feature / attribute / column** \mathbf{x}_j
- Use superscript in parenthesis to indicate particular **observation / instance/ case / row** $\mathbf{x}^{(i)}$
- So $x_j^{(i)}$ (or $x_{i,j}$) is the i -th observation in the j -th feature $x_j^{(i)}$

Example Datasets

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

Titanic

- Classic dataset with passenger information for the Titanic's fatal voyage, and whether they survived.
- Has missing values and information rich text fields (Name, ticket number).
- Task: classification — predict whether a passenger survived.

Algae Blooms

- Water quality study where samples were taken from different rivers over time.
- Recorded levels of (seven) chemical substances and population of (six) algae species and other information on the sample conditions.
- Task: regression — predict algae population level (7 separate populations).

Tips **dataset**

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4
5	25.29	4.71	Male	No	Sun	Dinner	4
6	8.77	2.00	Male	No	Sun	Dinner	2
7	26.88	3.12	Male	No	Sun	Dinner	4
8	15.04	1.96	Male	No	Sun	Dinner	2
9	14.78	3.23	Male	No	Sun	Dinner	2

No target column, so mainly just an exploratory data analysis problem. But questions of interest:

- How do factors **sex**, **smoker**, **day**, **time**, or **size** affect tip / percentage tip?
- Does **size** vary with **day**, **time**, **smoker**?

But some questions don't make sense

- What is the relationship between **sex** and **smoker**? — why should they be related?

This is the downside of automatic EDA tools such as **pandas-profiling** — you will drowned in statistics / charts.

Algae Blooms dataset

	Season	Size	Speed	max_pH	min_O2	mean_Cl	mean_NO3	mean_NH4	mean_oPO4	mean_PO4	mean_Chlor	a1	a2	a3	a4	a5

How well can we predict a passenger's survival using information at time of departure?

Before we start ... Loading libraries

We start by loading in the core data science modules...

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

matplotlib is an excellent visualisation library but some plots need additional configuration. seaborn sits above matplotlib and has a collection of visualisations optimised for statistical analysis. ...

```
import seaborn as sns
```

Next, we import some statistical modules ...

```
import scipy.stats as stats
import statsmodels.api as sm
import pingouin as pg
```

`scipy.stats` has a large number of distributions, parametric and nonparametric statistical tests, and descriptive statistics.
`statsmodels` is more focused on estimating statistical models.
`pingouin` overlaps with bits of `scipy.stats` and `statsmodels` but generates more details and nicer visualisations.

Finally we set options ...

```
plt.style.use("seaborn-darkgrid")
```

Before we start ... auto EDA using pandas—profiling

```
from pandas_profiling import ProfileReport
profile = ProfileReport(df, title="Tips Report", html={"style": {"full_width": True}}, sort="None")
profile
```

Summarize dataset: 100% 21/21 [00:05<00:00, 4.00it/s, Completed]

Generate report structure: 100% 1/1 [00:02<00:00, 2.78s/it]

Render HTML: 100% 1/1 [00:00<00:00, 1.72it/s]

pandas—profiling is nice, but see how slow it is on this tiny dataset. What would happen if we had 100K rows x 100 columns?

Before we start ... zero-code EDA using dtale

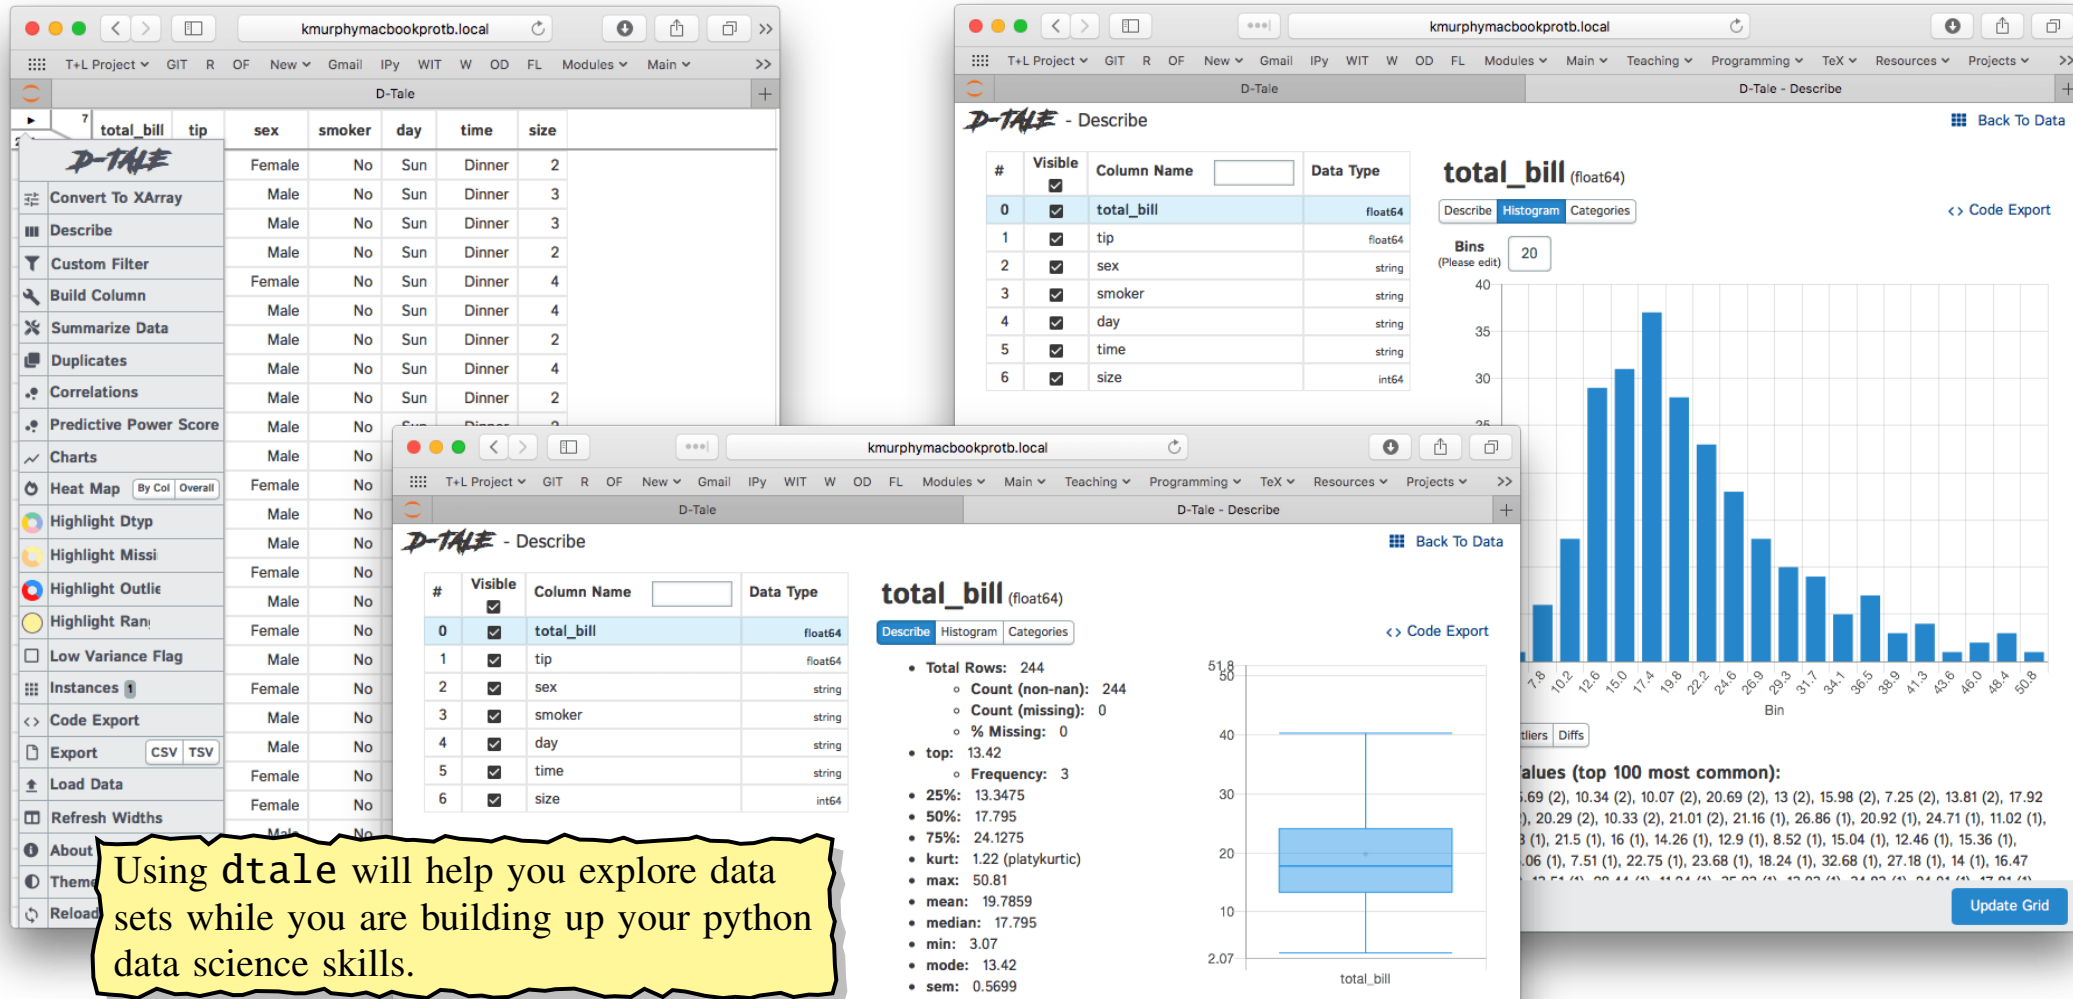

Well, almost zero code....

```
import pandas as pd
import dtale

# Read the Tips data into a dataframe, check it looks OK
df = pd.read_csv('tips.csv')
df.head()

# Run dtale to visualize the structure of the dataframe
dtale.show(df)
```

Before we start ... zero-code EDA using dtale

Using dtale will help you explore data sets while you are building up your python data science skills.

First Pass — Load Dataset and Initial Clean

- Load dataset
- Check variables names
- Verify variable types
- Identify (and possibly address) missing values

Tips — Load

```
df = pd.read_csv("tips.csv")
print(df.shape)
df.head(10)
```

```
(244, 7)
```

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4
5	25.29	4.71	Male	No	Sun	Dinner	4
6	8.77	2.00	Male	No	Sun	Dinner	2
7	26.88	3.12	Male	No	Sun	Dinner	4
8	15.04	1.96	Male	No	Sun	Dinner	2
9	14.78	3.23	Male	No	Sun	Dinner	2

```
df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
```

```
RangeIndex: 244 entries, 0 to 243
```

```
Data columns (total 7 columns):
```

```
#      Column      Non-Null Count  Dtype
```

```
0  total_bill  244 non-null  float64
```

```
1    tip       244 non-null  float64
```

```
2    sex       244 non-null  object
```

```
3  smoker     244 non-null  object
```

```
4    day       244 non-null  object
```

```
5    time      244 non-null  object
```

```
6    size      244 non-null  int64
```

```
dtypes: float64(2), int64(1), object(4)
```

```
memory usage: 13.5+ KB
```

Issue: categorical data treated as object (string).

Tips — Fix Data Types

I

```
df.sex.unique()
```

```
array(['Female', 'Male'], dtype=object)
```

```
df.sex = pd.Categorical(df.sex)  
df.sex.unique()
```

```
['Female', 'Male']  
Categories (2, object): ['Female', 'Male']
```

```
df.smoker.unique()
```

```
array(['No', 'Yes'], dtype=object)
```

```
df.smoker = pd.Categorical(df.smoker)  
df.smoker.unique()
```

```
['No', 'Yes']  
Categories (2, object): ['No', 'Yes']
```

```
df.day.unique()
```

```
array(['Sun', 'Sat', 'Thur', 'Fri'], dtype=object)
```

```
df.day = pd.Categorical(df.day, categories=['Thur', 'Fri', 'Sun', 'Sat'], ordered=True)  
df.day.unique()
```

```
['Sun', 'Sat', 'Thur', 'Fri']  
Categories (4, object): ['Thur' < 'Fri' < 'Sun' < 'Sat']
```

Tips — fix datatypes

```
df.time = pd.Categorical(df.time, categories=['Lunch', 'Dinner'], ordered=True)
df.time.unique()
```

```
['Dinner', 'Lunch']
Categories (2, object): ['Lunch' < 'Dinner']
```

```
df.info()
```

Converting to category will:

- Simplify visualisation (order can be preserved).
 - Reduce memory usage (not that big a deal for us).
 - Speed up I/O (depending on file format).
- ⇒ Convert to category is a bigger deal for features where the levels have an order.

```
<class 'pandas.core.frame.DataFrame'>
```

```
RangeIndex: 244 entries, 0 to 243
```

```
Data columns (total 7 columns):
```

#	Column	Non-Null Count	Dtype
0	total_bill	244 non-null	float64
1	tip	244 non-null	float64
2	sex	244 non-null	category
3	smoker	244 non-null	category
4	day	244 non-null	category
5	time	244 non-null	category
6	size	244 non-null	int64

```
dtypes: category(4), float64(2), int64(1)
```

```
memory usage: 7.4 KB
```

Titanic — load

- Dataset is split into two parts:

- `train.csv` — 891 rows with Survived column, used in EDA and model training.
- `test.csv` — 418 rows without the Survived column, used in competition scoring.

```
df = pd.read_csv("data/train.csv")
print(df.shape)
df.head(25)
```

	PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked
0	1	0	3	Braund, Mr. Owen Harris	male	22.0	1	0	A/5 21171	7.2500	NaN	S
1	2	1	1	Cumings, Mrs. John Bradley (Florence Briggs Th...	female	38.0	1	0	PC 17599	71.2833	C85	C
2	3	1	3	Heikkinen, Miss. Laina	female	26.0	0	0	STON/O2. 3101282	7.9250	NaN	S
											C123	S
											NaN	S
											NaN	Q
											E46	S
											NaN	S
											NaN	S
											NaN	C
											G6	S
											C103	S
											NaN	S
											NaN	S
											NaN	S
											NaN	Q
											NaN	S
											NaN	S
19	20	1	3	Masselmani, Mrs. Fatima	female	NaN	0	0	2649	7.2250	NaN	C
20	21	0	2	Fynney, Mr. Joseph J	male	35.0	0	0	239865	26.0000	NaN	S
21	22	1	2	Beesley, Mr. Lawrence	male	34.0	0	0	248698	13.0000	D56	S
22	23	1	3	McGowan, Miss. Anna "Annie"	female	15.0	0	0	330923	8.0292	NaN	Q
23	24	1	1	Sloper, Mr. William Thompson	male	28.0	0	0	113788	35.5000	A6	S
24	25	0	3	Palsson, Miss. Torborg Danira	female	8.0	3	1	349909	21.0750	NaN	S

- We could convert `Sex` or `Embarked`, to a category, but since their levels are not ordered there is no big advantage.
- We don't want to convert `Name`, `Ticket` and `Cabin` since we want to perform further text processing on these columns. For example, extracting title (Capt, Mr, Miss, etc.) out of `Name`.
- We have missing values (**that are plausibly linked to target**) that we need to deal with.

```
df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 891 entries, 0 to 890
Data columns (total 12 columns):

Coil 1999 Competition Data Data Set
Download: [Data Folder](#), [Data Set Description](#)

Abstract: This data set is from the 1999 Computational Intelligence and Learning (COIL) competition. The data contains measurements of river chemical concentrations and algae densities.

Data Set Characteristics:	Multivariate	Number of Instances:	340	Area:	Physical
Attribute Characteristics:	Categorical, Real	Number of Attributes:	17	Date Donated	1999-09-09
Associated Tasks:	N/A	Missing Values?	No	Number of Web Hits:	52986

Data Set Information:

This data comes from a water quality study where samples were taken from a river. The data includes measurements of chemical substances including: nitrogen in the form of nitrates, nitrites, and ammonia, as well as algae frequency distributions.

The competition involved the prediction of algal frequency distribution when the sample was taken, the river size and its flow velocity.

Algae_Blooms — load (1st attempt)

Pandas function `pd.read_table`, is a more general function than `read_csv`.

```
df = pd.read_table('src/Analysis.txt')
print(df.shape)
df.head()
```

(199, 1)

winter	small	medium	8.00000	9.80000	60.80000	6.23800	578.00000	105.00000	170.00000	50.00000	0.00000	0.00000	0.00000	0.00000	34.20000	8.30000	0.00000
--------	-------	--------	---------	---------	----------	---------	-----------	-----------	-----------	----------	---------	---------	---------	---------	----------	---------	---------

0 spring small medium 8.35000 ...

1 autumn small medium 8.10000 1...

2 spring small medium 8.07000 ...

3 autumn small medium 8.06000 ...

4 winter small high 8.25000 13....

Two problems, first row was treated as column headers, and we need to specify the character(s) used to separate columns

Algae_Blooms — load (2nd attempt)

```
df = pd.read_table('src/Analysis.txt', sep='\s+', header=None)
print(df.shape)
df.head()
```

(200, 18)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
0	winter	small	medium	8.00000	9.80000	60.80000	6.23800	578.00000	105.00000	170.00000	50.00000	0.0	0.0	0.0	0.0	34.2	8.3	0.0
1	spring	small	medium	8.35000	8.00000	57.75000	1.28800	370.00000	428.75000	558.75000	1.30000	1.4	7.6	4.8	1.9	6.7	0.0	2.1
2	autumn	small	medium	8.10000	11.40000	40.02000	5.33000	346.66699	125.66700	187.05701	15.60000	3.3	53.6	1.9	0.0	0.0	0.0	9.7
3	spring	small	medium	8.07000	4.80000	77.36400	2.30200	98.18200	61.18200	138.70000	1.40000	3.1	41.0	18.9	0.0	1.4	0.0	1.4
4	autumn	small	medium	8.06000	9.00000	55.35000	10.41600	233.70000	58.22200	97.58000	10.50000	9.2	2.9	7.5	0.0	7.5	4.1	1.0

- Now, notice that the number of data row changed from 199 to 200 since the first row is now counted as a data row. And now we are using default columns names.
- The "\s+" matches one or more spaces. This is an example of a regex.
- We need to name the columns.

Algae_Blooms — load (3rd attempt)

```
names = ('Season', 'Size', 'Speed', 'max_pH', 'min_O2', 'mean_Cl', 'mean_NO3', 'mean_NH4', 'mean_oP04',
         'mean_PO4', 'mean_Chlor', 'a1', 'a2', 'a3', 'a4', 'a5', 'a6', 'a7')
```

```
df = pd.read_table('src/Analysis.txt', sep='\s+', names=names)
```

```
print(df.shape)
```

```
df.head()
```

(200, 18)

	Season	Size	Speed	max_pH	min_O2	mean_Cl	mean_NO3	mean_NH4	mean_oP04	mean_PO4	mean_Chlor	a1	a2	a3	a4	a5	a6
0	winter	small	medium	8.00000	9.80000	60.80000	6.23800	578.00000	105.00000	170.00000	50.00000	0.0	0.0	0.0	0.0	34.2	8.3
1	spring	small	medium	8.35000	8.00000	57.75000	1.28800	370.0									
2	autumn	small	medium	8.10000	11.40000	40.02000	5.33000	346.6									
3	spring	small	medium	8.07000	4.80000	77.36400	2.30200	98.18									
4	autumn	small	medium	8.06000	9.00000	55.35000	10.41600	233.7									

Dataframe looks a bit better, but why are numeric columns converted as **object**?
Reading instructions.txt we see that missing values are indicated by XXXXXX.

```
<class 'pandas.core.frame.DataFrame'>
```

```
RangeIndex: 200 entries, 0 to 199
```

```
Data columns (total 18 columns):
```

#	Column	Non-Null Count	Dtype
---	--------	----------------	-------

0	Season	200 non-null	object
---	--------	--------------	--------

1	Size	200 non-null	object
---	------	--------------	--------

2	Speed	200 non-null	object
---	-------	--------------	--------

3	max_pH	200 non-null	object
---	--------	--------------	--------

4	min_O2	200 non-null	object
---	--------	--------------	--------

5	mean_Cl	200 non-null	object
---	---------	--------------	--------

6	mean_NO3	200 non-null	object
---	----------	--------------	--------

7	mean_NH4	200 non-null	object
---	----------	--------------	--------

8	mean_oP04	200 non-null	object
---	-----------	--------------	--------

9	mean_PO4	200 non-null	object
---	----------	--------------	--------

10	mean_Chlor	200 non-null	object
----	------------	--------------	--------

11	a1	200 non-null	float64
----	----	--------------	---------

12	a2	200 non-null	float64
----	----	--------------	---------

Algae_Blooms — load (4th attempt)

V

```
names = ('Season', 'Size', 'Speed', 'max_pH', 'min_O2', 'mean_Cl', 'mean_NO3', 'mean_NH4', 'mean_oP04',
         'mean_PO4', 'mean_Chlor', 'a1', 'a2', 'a3', 'a4', 'a5', 'a6', 'a7')
```

```
df = pd.read_table('src/Analysis.txt', sep='\s+', names=names, na_values='XXXXXXX')
```

```
print(df.shape)
```

```
df.head()
```

(200, 18)

	Season	Size	Speed	max_pH	min_O2	mean_Cl	mean_NO3	mean_NH4	mean_oP04	mean_PO4	mean_Chlor	a1	a2	a3	a4	a5	a6
0	winter	small	medium	8.00	9.8	60.800	6.238	578.00000	105.000	170.00000	50.0	0.0	0.0	0.0	0.0	34.2	8.3
1	spring	small	medium	8.35	8.0	57.750	1.288	370.00									
2	autumn	small	medium	8.10	11.4	40.020	5.330	346.66									
3	spring	small	medium	8.07	4.8	77.364	2.302	98.182									
4	autumn	small	medium	8.06	9.0	55.350	10.416	233.70									

Now some variables have missing values

Also we should convert Season, Size and Speed to category and ensure the levels are ordered.

```
<class 'pandas.core.frame.DataFrame'>
```

```
RangeIndex: 200 entries, 0 to 199
```

```
Data columns (total 18 columns):
```

#	Column	Non-Null Count	Dtype
0	Season	200 non-null	object
1	Size	200 non-null	object
2	Speed	200 non-null	object
3	max_pH	199 non-null	float64
4	min_O2	198 non-null	float64
5	mean_Cl	190 non-null	float64
6	mean_NO3	198 non-null	float64
7	mean_NH4	198 non-null	float64
8	mean_oP04	198 non-null	float64
9	mean_PO4	198 non-null	float64
10	mean_Chlor	188 non-null	float64
11	a1	200 non-null	float64
12	a2	200 non-null	float64
13	a3	200 non-null	float64
14	a4	200 non-null	float64
15	a5	200 non-null	float64
16	a6	200 non-null	float64
17	a7	200 non-null	float64

Algae_Blooms — Fix Data Types

II

The three categorical variables have levels with a natural order \Rightarrow convert to category and specify order:

```
df.Season = pd.Categorical(df.Season, categories=['spring', 'summer', 'autumn', 'winter'], ordered=True)
print(df.Season.unique())
```

```
['winter', 'spring', 'autumn', 'summer']
Categories (4, object): ['spring' < 'summer' < 'autumn' < 'winter']
```

```
df.Size = pd.Categorical(df.Size, categories=['small', 'medium', 'large'], ordered=True)
print(df.Size.unique())
```

```
['small', 'medium', 'large']
Categories (3, object): ['small' < 'medium' < 'large']
```

```
df.Speed = pd.Categorical(df.Speed, categories=['low', 'medium', 'high'], ordered=True)
print(df.Speed.unique())
```

```
['medium', 'high', 'low']
Categories (3, object): ['low' < 'medium' < 'high']
```

Algae_Blooms — Identification of Missing Values (NA)

1 Which columns have missing values?

```
df.isna().sum()
```

```
Season      0
Size        0
Speed       0
max_pH      1
min_O2      2
mean_Cl     10
mean_NO3    2
mean_NH4    2
mean_oPO4   2
mean_PO4    2
mean_Chlor  12
a1          0
a2          0
a3          0
a4          0
a5          0
a6          0
a7          0
dtype: int64
```

- Two columns (features) account for 22 NAs, but cannot just drop them as will lose a lot of information.
- Two rows (observations) account for 12 NAs \Rightarrow remove.
- Removing other rows with a NA will result in a loss of 14 rows (7% of the data), instead will impute later.

2 Which rows have missing values?
How many NAs per row?

```
df.isna().sum(axis=1).value_counts()
```

```
0    184
1      7
2      7
6      2
dtype: int64
```

4 Rows / Cols to drop?

```
df.loc[df.isna().sum(axis=1)==6]
```

	Season	Size	Speed	max_pH	min_O2	mean_Cl	mean_NO3	mean_NH4	mean_oPO4	mean_PO4	mean_Chlor	a1	a2	a3
61	summer	small	medium	6.4	NaN	NaN	NaN	NaN	NaN	14.0	NaN	19.4	0.0	0.0
198	winter	large	medium	8.0	7.6	NaN	NaN	NaN	NaN	NaN	NaN	0.0	12.5	3.0

```
df = df.loc[df.isna().sum(axis=1)<6].copy()
print(df.shape)
```

```
(198, 18)
```

After Loading and Initial Clean — Where are we?

Tips

- ✓ Loaded data, corrected dtypes (categorical with order levels)
- ✓ Sanitised column names — not needed, but note column name `size` shadows pandas dataframe function `size` \Rightarrow so use `df["size"]` instead of `df.size`.
- ✓ No missing values

Titanic

- ✓ Loaded data — no conversion of dtypes needed (but if you don't plots/crosstab order won't agree)
- ✓ Sanitised column names — not needed,
 - Missing values in Age ($177/891=20\%$), Cabin ($687/891=77\%$), and Embarked ($2/891=0.2\%$).
 - A feature with 77% missing values should be considered for deletion, but what if the presence of a missing value actually tells us something? \Rightarrow convert to a boolean feature.

Algae Blooms

- ✓ Loaded data, corrected dtypes (categorical with ordered levels)
- ✓ Sanitised column names.
 - Missing values
 - Removed two rows with 6 NA each, accounted for $12/33=36\%$ of the missing values.
 - Remaining, 21 NAs are concentrated in `mean_CL` (8) and `mean_Chlor` (10). EDA will suggest options.

After Loading and Initial Clean — Where are we?

II

Next we might

- Save result of initial clean:
 - To either a CSV (if we don't mind losing dtype metadata)

```
df.to_csv('data/Analysis.csv', index=False)
```

- To (say) pickle format (to keep dtype metadata)

```
df.to_pickle('data/Analysis.pkl')
```

Later can read dataframe back in using

```
df = pd.read_pickle('data/Analysis.pkl')  
print(df.shape)  
df.head(1)
```

- If the dataset is large (>100K rows), save a (reproducible) sample of the dataset for later EDA to speed up calculations (especially visualisations).

```
df.sample(frac=.25, random_state=42).to_pickle('data/Analysis_sample.pkl')
```

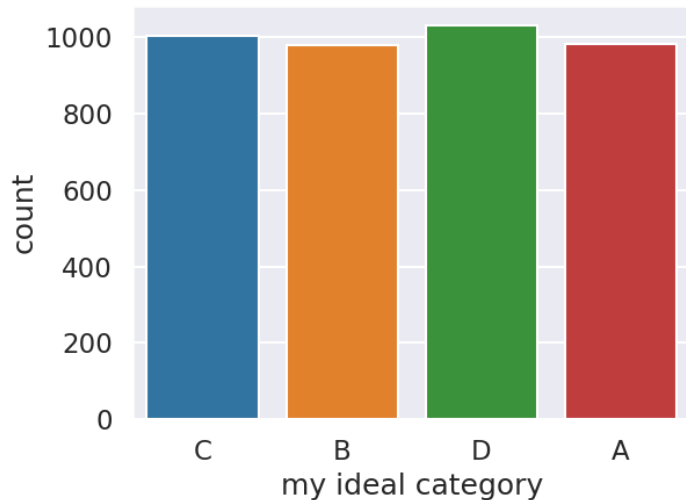

A Selection of Statistical Visualisations and Metrics

		Relationship to Target	
		Categorical	Numerical
Categorical	Feature		
	nunique, unique, describe, value_counts, ...	crosstab, ...	boxplot, ...
	countplot, ...	countplot, ...	catplot, boxplot, ...
Numerical	describe, ...	groupby+describe, ...	correlations, ...
	histplot, boxplot, displot, qqplot, ...	catplot, boxplot, ...	lmpplot, ...

Categorical Variables

The Ideal

- Each level equally likely.
- Not too many levels: 2–12(ish).

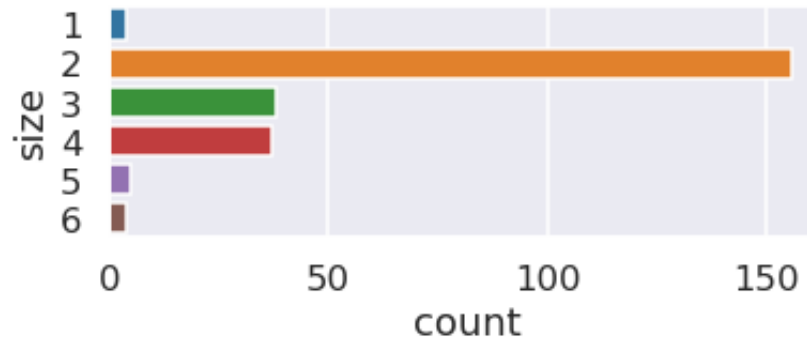

Tools

- `nunique`, `unique`, `value_counts`.
- `sns.countplot` — shows the counts of observations in each categorical level using bars.

Reality

```
sns.countplot(y="size", data=df);
```

Tips

- If size was the target, then most models will train towards the majority class (`size=2`).
- If size was a feature, then quality of predictor could vary greatly depending on the feature categorical level.
- Consider merge/drop rare category levels.

Categorical Variables — Relationship with (Categorical) Target

`sns.countplot(x="Sex", hue="Survived", data=df);`

```
pd.crosstab(columns=df.Sex, index=df.Survived, margins=True, normalize='columns') \
    .style.format("{:.2%}").background_gradient(cmap='summer_r')
```

sex	Female	Male	All
smoker			
No	62.07%	61.78%	61.89%
Yes	37.93%	38.22%	38.11%

No relationship between sex and smoker

Sex	female	male	All
Survived			
0	25.80%	81.11%	61.62%
1	74.20%	18.89%	38.38%

Strong relationship between Sex and Survived

Categorical Variables — Relationship with (Numerical) Target

I

```
sns.countplot(x="Size", data=df);
```

- Shows the counts of observations in each categorical level using bar (height/width).

Is it usable?

```
sns.catplot(x="Size", y="a4", data=df, kind='bar');
```

- Shows the average level (mean) and uncertainty (std) of the numerical target (a4) in each categorical level of the categorical variable.
- Vertical bar shows 95% confidence interval.

Is it useful?

Categorical Variables — Relationship with (Numerical) Target

II

The option `kind` in `catplot` can be:

- bar and point show essentially the same information, but point is more compact when comparing multiple categorical features to a continuous target on the same plot.
- strip shows individual observations — useful (as in this case) to show that the larger uncertainty in `Size="small"` observations is mainly due to two outliers.

Example — Dataset: Algae Blooms, Feature: Season, Target: a1

```
df.groupby("Season")["a1"].agg(["mean", "count", "std"])
```

Season	mean count		std
	\bar{x}	n	σ
spring	16.649057	53	23.093786
summer	16.038636	44	17.920798
autumn	17.745000	40	21.611203
winter	17.498361	61	22.568256

- Countplot shows no issues with feature **Season** — all levels approximately equally represented.
 - Catplots show slightly less spread in **a1** for **Season="summer"** observations. (**strip** shows smaller range, **point** shows smaller standard deviation).
- ⇒ Mean levels of **a1** for different levels of **Season** are well within the 95% confidence intervals ($\bar{x} \pm \sigma 1.96/\sqrt{n}$), so no/weak relationship between categorical feature and numerical target.

Example — Dataset: Algae Blooms, Feature: Size, Target: a1

```
df.groupby("Size")["a1"].agg(["min", "max", "mean", "count", "std"])
```

	min	max	mean	count	std
Size			\bar{x}	n	σ
small	0.0	89.8	27.255714	70	24.895426
medium	0.0	86.6	11.267857	84	17.163124
large	0.0	56.8	11.611364	44	16.556123

- Countplot shows no issues with feature Size.
 - Catplot (point) shows that levels of a1 are higher for Size="small" observations.
- ⇒ Confidence interval for Size="small" observations do not overlap with CI for other levels, so significant relationship between categorical feature and numerical target.

Numerical Variables

Things here are more complicated as a numerical variable could follow many different distributions. Here we look at data following the standard normal distribution. To start we generate 10,000 values and put in to new DataFrame, df2.

```
rv = stats.norm()
data = rv.rvs(size=10_000)
df2 = pd.DataFrame(data, columns=["x"])
df2.head(5)
```

	x
0	0.498338
1	0.683507
2	-1.088138
3	-1.644050
4	0.049947

```
sns.histplot(x="x", data=df2, kde=True);
```

```
sns.boxplot(x="x", data=df2);
```

Histplot (Histogram) and Boxplot

- Histogram is useful in depicting location, spread and shape.
- Curve, is estimate of shape given infinite data and infinite number of bins.
- Boxplots also depicts location, spread and shape, but uses median for estimate of centre, and quartiles for spread.
- Half the data is within the box, data points outside the whiskers (lines) are possible outliers, denoted by circles.

Cumulative Plot and QQ-Plot

```
sns.ecdfplot(data=df2, x="x");
```

- Represents the proportion of observations less than or equal to given value.

```
import pingouin as pg
pg.qqplot(df2.x);
```

- Plot of observed quantiles against theoretical (assuming normal) quantiles. If both sets of quantiles came from the same distribution, we should see the points forming a line that's roughly straight.

Example — Dataset: Tips, Feature: total_bill

```
df.total_bill.describe()
```

```
count    244.000000
mean      19.785943
std        8.902412
min        3.070000
25%       13.347500
50%       17.795000
75%       24.127500
max       50.810000
Name: total_bill, dtype: float64
```

- Data is bell curve shaped, but right skewed (data is more spread out to the right).
- Outliers to the right.
- QQ-Plot indicate that data is not normal, but we could transform it to be more closer to normal.

Example — Dataset: Titanic, Feature: Fare

`df.Fare.describe()`

```
count    891.000000
mean      32.204208
std       49.693429
min        0.000000
25%        7.910400
50%       14.454200
75%       31.000000
max      512.329200
Name: Fare, dtype: float64
```

- This variable is more skewed and dominated by its outliers which need to be resolved.

Warning — Plot Output Depends on Data Assumptions

```
df = pd.read_csv("data/train.csv")
sns.catplot(data=df, x="Fare", y="Survived");
```

- seaborn tries to infer the correct graph based on the data values/type, but it does not always get it correct.
- Survived stores 0 and 1 and has dtype `int`.
- Converting to a Categorical with numeric levels is not enough.
- `astype(str)` converts `0` and `1` to `"0"` and `"1"`.

```
df = pd.read_csv("data/train.csv")
df.Survived = df.Survived.astype(str)
sns.catplot(data=df, x="Fare", y="Survived");
```

```
df = pd.read_csv("data/train.csv")
df.Survived = pd.Categorical(df.Survived)
sns.catplot(data=df, x="Fare", y="Survived");
```

Summary

- After reading in the data, exploratory data analysis begins
- Pass 1 is all about assessing the structure and cleanliness of the data
 - ① Are the column names descriptive and short, or do we need to rename them?
 - ② What datatype is each column - are there any surprises there?
 - ③ How are missing values handled, and can we standardise this?
- Passes 2 and 3 will examine the data more closely, in a repeatable fashion
- Pandas and seaborn offer easy-to-use ways of visualising columns, noting
 - ① their datatype
 - ② their cardinality
 - ③ the visualisation objective: observe distributions or relationships
